

## **Final Submission**

### **Basic User Cases:**

- User account to display personal to-do items
  - o User authentication using devise gem
  - o Forgot password (email password reset)
- To-do list
  - o Consists of description, stipulated deadline, tag lists, as well as edit and delete button (backend stored as json api, frontend using react)
  - o Search by any relevant text

### **Problems faced:**

Due to improper reading of requirement of this task, I thought the frontend can use rails views. So the second half of the project, I rebuilt everything to integrate it with react. More implementations can possibly be done.
